Explanation

- Landslide undifferentiated from talus and/or colluvial deposits - May include deep or shallow landslides mapped with talus and/or colluvial deposits.
- Deep or unclassified landslide - Generally 10 feet (3 m) thick or more and shows characteristic landslide morphology. May include areas of complex or composite landsliding where landslide density is too great to show individual landslides separately. Also includes unclassified landslides (original source was not specific about landslide type).
- Shallow landslide - Generally less than 10 feet (3 m) thick and shows characteristic landslide morphology. Includes mainly debris slides and debris flows. May include some composite landslides.
- Lateral spread and/or flow failure - Liquefaction-induced landslides typically associated with earthquakes; generally occur on very gentle slopes or flat terrain.
- Landslide and/or landslide undifferentiated from talus, colluvial, rock-fall, glacial, and soil-creep deposits - May include deep or shallow landslides mapped with talus, colluvial, rock-fall, glacial, and/or soil-creep deposits; primarily mapped and compiled by Roger B. Colton, U.S. Geological Survey.
- Landslide scarp - Landslide feature found near the head. Identified as the area where landslide material has moved downslope and away from the undisturbed ground. Hachures on down-dropped side.
- Debris-flow travel path - Identifies the path of a debris flow (shallow landslide).
- Not classified - Includes areas not mapped in the original studies compiled for this map, as well as mapped areas with no identified landsliding.

Although this product represents the work of professional scientists, the Utah Department of Natural Resources, Utah Geological Survey, makes no warranty, expressed or implied, regarding its suitability for a particular use. The Utah Department of Natural Resources, Utah Geological Survey, shall not be liable under any circumstances for any direct, indirect, special, incidental, or consequential damages with respect to claims by users of this product. These maps are intended for use at 1:100,000 and smaller scales, and are designed for general planning purposes to indicate the need for site-specific landslide investigations. The Utah Geological Survey does not guarantee accuracy or completeness of the data.

This study represents a compilation of data to mid-2007. The Utah Geological Survey (UGS) intends to periodically update the data. Consult the UGS Geologic Hazards Program for updates and more information.
