Terry Wetz  
International Uranium Corporation  
1050 17<sup>th</sup> St., Suite 950  
Denver, CO 80265

Dear Mr. Wetz,

This letter is in response to your inquiry on the Tony M. mine. We quickly compiled unedited information from undocumented file data so we can not guarantee the accuracy or usefulness of any of the data (see full disclaimer at the end of this letter). This information includes several sections, (1) a summary, selected bibliography, and location map compiled by Taylor Boden of our staff, (2) notes from a field investigation in 1985 by a former UGS geologist, Hasan Mohammed, (3) a bundle of photocopies of CRIB mineral resource database entry forms for the Mt. Hillers quadrangle and an accompanying page-sized map and mine index, (4) five CDs containing scanned images of Tony M. maps from our files (in TIFF format). These maps are potentially the most useful part of the packet but they may be out-of-date and incomplete. They are also hard to work with. Because they were color coded, the only way we could reproduce them was to scan them at high resolution but that created huge files that can not be e-mailed and are very slow to open and manipulate in graphics software.

The CRIB forms, index, and annotated topo. map actually predate the main development of the Tony M. mine so it is not shown on this map. The map is only included to show some of the surrounding workings.

The scanned maps on CD show extensive drilling and drifting and some production data is included below, as well as some data on what reserves may remain.

#### T. BODEN - SUMMARY

#### Uranium Inquiry of School Trust Lands Associated with the Tony M. Mine Section 16, T. 35 S., R. 11 E., Garfield County, Utah

##### Summary

There are approximately 21 known uranium-vanadium mines and prospects within T. 35 S., R. 11 E., Garfield County, Utah. The State of Utah, School and Institution Trust Land Administration (SITLA) section 16 tract contains several sites, as well as several others that are just outside the tract's boundary (see map). The Tony M. uranium-vanadium mine specifically inquired about lies mostly within section 16, even though it is not shown on the Mt. Hillers Quadrangle. Mines and prospects shown in section 16 on the map were most likely developed into the Tony M. mine.

The Tony M. mine is located in the Shootaring (Shitamarine) Canyon area (see map) 175 mi southwest from Grand Junction, Colorado on the south flank of the Henry Mountains. The area is 2 mi west of Utah State Highway 276; approximately 50 mi south of Hanksville, Utah, and 15 mi north of Bullfrog

Marina, located on Lake Powell. The mine is situated in canyonlands terrain at an elevation of 4550 ft. The climate is arid with an average precipitation of 7 in.

The Tony M. mine is located in a structural basin containing sedimentary rocks ranging from Mesozoic to Cenozoic in age with some Tertiary intrusives present. Ore grade mineralization at the Tony M. mine occurs in the lower sequence of the Salt Wash Member of the Jurassic Morrison Formation. The Salt Wash Member in the area is composed of fluvial sandstone and interbedded mudstone, and is approximately 510 ft thick at the Tony M. mine. Ore mineralization is associated with organic matter and occurs as intragranular disseminations within the sandstones and mudstones. Coffinite is reported as the most abundant ore mineral followed by uraninite and carnotite. Doelling, 1967 reported a vanadium-uranium ratio for three samples collected in the Shootaring Canyon area as 1.05:1.

Utah Division of Oil, Gas and Mining records indicate active mining occurred between 1979 and 1984, yearly production is as follows; 1979-20,569 tons ore, 1980-34,159 tons ore, 1981-none (records indicate 67,703 tons ore moved, stock-piling activity most likely), 1982-88,914 tons ore, 1883-none, and 1984-none. The mine site has since been completely reclaimed. The Tony M. mine five year plan report (1982 through 1986) gives an estimation of ore reserves as 5.2 million tons containing 13.7 million lb of U<sub>3</sub>O<sub>8</sub> at an average grade of 0.13% U<sub>3</sub>O<sub>8</sub>.

Utah Geological Survey CRIB forms for sites associated with section 16, T. 35 S., R. 11 E., are attached. Tiff file maps on CD depicting sections 16 and 9 exploration drilling, mine longhole exploration drilling, mine development, and ore body delineation and evaluation are also attached.

## H. MOHAMMAD - FIELD INVESTIGATION

**ORE MINERALS:** CARNOTITE URANINITE COFFINITE CARNOTITE MONTROSEITE VANADIUM CHLORITE

**AVERAGE ORE GRADE:** 0.035 - 2.5% EU3O8

**OPERATOR CIRCA 1985:** PLATEAU RESOURCES LIMITED, 772 HORIZON DRIVE, GRAND JUNCTION, COLORADO

**DEVELOPMENT:** EXPLORATION DRILLING WAS INITIATED IN THE VICINITY OF OUTCROP MINERALIZATION DURING 1976. BY THE YEAR 1983 APPROXIMATELY 2000 ROTARY DRILL HOLES TOTALING NEARLY 1,000,000 FEET HAVE BEEN COMPLETED ON THE PROPERTY. DRILLING CONTINUED IN ORDER TO BETTER DEFINE THE DETAILS OF THE ORE BODIES. WITHIN A RADIUS OF 2 SQUARE MILES AROUND THE PROPERTY SEVERAL EXPLORATORY PITS, CHANNELS, AND DOZER CUTS HAVE BEEN MADE TO STUDY THE HOST ROCKS.

**WORKINGS:** SEVERAL ADITS. TOTAL LENGTHS OF THE WORKINGS MORE THAN 5000 FT. EXACT FIGURES OF THE LENGTHS OF WORKINGS NOT KNOWN. MINE DEVELOPED BY A DOUBLE ENTRY SYSTEM OF TWO PARALLEL DECLINES SPACED FIFTY FEET APART. THE TWO HAULAGEWAYS ARE 8 FEET HIGH AND 12 FEET WIDE. THE DECLINES DRIVEN DOWN A MINUS THREE PERCENT GRADE ALONG A TREND OF NORTH 22 WEST WHICH COINCIDES WITH THE LONG AXIS OF THE ORE TREND. ACCESS TO THE INDIVIDUAL ORE BODIES IS THROUGH LATERALS DEVELOPED AT RIGHT ANGLES TO THE MAIN HAULAGE WAYS. ORE MINED BY A MODIFIED ROOM AND PILLAR SYSTEM. MINED ORE PROCESSED IN A FACILITY SITUATED ABOUT 3 MILES FROM THE MINE.

**PETROLOGY:** THE HOST SANDSTONE IS LIGHT GRAY TO GRAY, MASSIVE BEDDING, MOSTLY INDISTINCT. HAS SMALL GRAY PELLETS IN LAYER 1/2 TO 1 INCH THICK. MEDIUM-GRAINED TO CONGLOMERATIC, SOFT, WEAKLY CEMENTED BY CALCITE AND CLAY. SUGARY, BLEACHED, AND SOMETIMES CROSS-BEDDED. MUDSTONE AND SHALE INTERBEDS ARE RED GRAY TO BROWN AND LENTICULAR. FEW DISCONTINUOUS THIN BANDS OF GRAY TO BROWN SILTSTONES ARE ALSO FOUND. THE INTERBEDS OF CONGLOMERATES ARE YELLOW BROWN AND BUFF WITH CHERT PEBBLES UP TO 1/2 INCH IN DIAMETER WHICH MAKE UP FROM 10 TO 90 PERCENT OF THE TOTAL VOLUME OF THE ROCK. THE HOST ROCKS CONTAIN ABUNDANT WOOD FRAGMENTS AND CARBONACEOUS MATTER. LIMONITIC AND HEMATITIC STAINS AND VEINS OF CALCITE AND QUARTZ ARE OCCASIONALLY FOUND. FRACTURING, ALTERATION, AND BLEACHING OF THE HOST ROCKS ARE THE CHARACTERISTIC FEATURES. THE ORE BODIES CONSIST OF A CONCENTRATION OF VARIOUS URANIUM AND VANADIUM MINERALS IN SAND LENSES. MOST OF THE ORE MINERALS OCCUPY PORE SPACES IN THE SANDSTONE AND CONGLOMERATES. THE LARGEST AND RICHEST ORE BODIES ARE ELONGATE AND CRUDELY SEMI-CYLINDRICAL.

A ubiquitous UPS truck is one of the rare visitors to Plateau Resources' Ticaboo mill. The accompanying mine, known as the Tony M, has been sold and the mill and accompanying town and resort site are on the market. The mill is 1 of only 3 remaining in the nation that are permitted for operation. (PAY DIRT photos by Gary Dillard.)

## Come on, high-rollers, here's a chance to make a bundle

By Bill Epler  
Staff Reporter

Ticaboo is for sale.

What did you say? What the hell is it and where is it? Are you pulling my leg, man?

Well, pull up your chair and I'll tell you a story about a \$129 million uranium venture, including a mine and mill that never went into commercial production, and a chunk of land with great development possibilities. If you are an entrepreneur with the soul of a gambler and the wherewithal to back it up, here's a chance to make not 1, but 2 fortunes — if the chips fall right.

Open up your atlas to the map of Utah. If you look down in the far southeastern corner, just up from Bullfrog Marina on Lake Powell, you'll find — if your map goes into great detail — a tiny dot labeled Ticaboo.

That's where Consumers Power Company of Jackson, Michigan has a deal for you, offering its long-held property close by State Highway 276. The price has not been revealed, but a spokesman for the owner says an

acceptable figure is far below the investment cost.

As is so often the case, the best way to tell this story is to start at the beginning — way back in the late 1930s. There isn't enough space in this issue to tell all the details, so we will boil it down to the most essential parts.

The setting is the Ticaboo Plateau, a name bestowed a long time ago by the Ute Indians. In their language, Ticaboo means "friend" or "friendly place."

It's in a high-desert area on the western slopes of the Henry Mountains that include a north-south string of 5 peaks ranging from 7,930-foot Mt. Holmes to 11,506-foot Mt. Ellen. Rearing up behind Ticaboo is the southernmost peak, 8,150-foot Mt. Ellsworth. Off to the west a few miles is the Waterpocket Fold, a tortured, high north-south escarpment nearly 100 miles long.

In between the 2 are plateaus cut by deep, steep-walled canyons that have eroded through thick layers of sandstone. It's a rugged, arid land with few roads and even fewer inhabitants. The only way to get around is by

horseback or on foot, and then mainly either in the bottom of the canyons or on top of the mesas as there are only a few places where you can get up or down between the 2.

### Discovered way back in 1937

Into this particular section of the rugged Colorado Plateau in the 1930s came the late G.J. "Tony" Mastrovich of Grand Junction who for many years was employed by Climax Molybdenum. As we understand it, however, he was prospecting on his own, looking for vanadium deposits.

In addition to his knowledge of geology, Mastrovich's prospecting equipment consisted of an unusual combination — a horse, binoculars and a high-powered rifle. As he slowly rode along the bottoms of the canyon, the steep vertical rock walls towering above him exposed millions of years of geological formations, including the one he was looking for — the Salt Wash member of the Morrison.

Since there was no practical way on a scouting trip to get up to and follow along the

## Ticaboo . . .

formations' exposures, Mastrovich used his binoculars to visually follow the outcrops, looking for the telltale colors of vanadium deposits. Whenever he spotted something that looked promising, he would shoot it with the rifle to break out pieces he picked up at the bottom of the walls for closeup examination and assaying.

It was in 1937 that he found what he was looking for in Shitamaring (another Indian name?) Canyon. As we understand it, he found a pretty good deposit of vanadium and located a number of claims. But the location was so remote and difficult to access no one was interested in developing it, especially when ample supplies of vanadium, used to harden steel, were readily available elsewhere.

But Mastrovich hung on to his claims, hoping that some day the situation would change. That it did, years later, and, as frequently happens in the mining industry, in a completely unexpected way.

As miners know, often found associated with vanadium deposits on the Colorado Plateau is uranium. Mastrovich knew it was present in his vanadium deposit, but in those days it was little more than a curiosity. French scientists Marie and Pierre Curie had long ago secured the small quantities of uranium and radium needed for their experiments from Colorado Plateau vanadium mines. Except for occasional orders of small amounts for medical and experimental purposes there was no further demand.

### Finally began coming together

Development of the atomic bomb near the end of World War II, of course, changed all that, touching off the first of several uranium stampedes as the Atomic Energy Commission offered high prices for uranium for the nation's nuclear weapons program.

With that Mastrovich figured he had it made, but success proved elusive — again because of the difficult location and low grade, only 0.14 percent U3O8. Although there were various deals that came and went, it was not until the second uranium boom sparked by the demand created by the budding nuclear power industry that things began to come together for him.

Then Consumers Power (CP) appeared on the scene. For details on that, we turn to Roger Berg, vice president of Plateau Resources, a wholly owned subsidiary of the Michigan utility, headquartered in Jackson.

CP, Berg told PAY DIRT in a telephone interview, built and operated the first nuclear power plant in the United States, the 75,000 KW Big Rock Point plant that came on line in 1962. At that small size, it was a pilot plant to gain experience and determine economics.

In 1970 it brought on line its 812,000 KW Palisades nuclear plant and began construc-

tion of its proposed 1.4 million KW Midland nuclear power plant.

At about this time demand for uranium for nuclear plant fuel became greater than supply, sending prices skyrocketing and making it impossible for utilities to secure long-term supply contracts. As a result, nuclear plant operators had to secure and develop their own supplies.

So, to nail down fuel for its existing and planned plants, CP formed Plateau Resources Ltd. in 1976 and went looking. The

search led it to Ticaboo and the Tony M mine in Shitamaring Canyon. The deal to acquire the mine was completed in May 1977 and in September underground mine development got under way with driving of portals on structure in the canyon wall.

Four miles south of the mine, Plateau bought a 265-acre tract of land as the site for a state-of-the-art uranium mill it built at a cost of about \$54 million. Although the mill is rated at 750 tpd, the contractor, Mountain States Engineering of Tucson, figured it

## THIS PRETTY MUCH SAYS IT ALL.

### Poz-o-Cap®

*A New Era in Dust Control*

	Poz-o-Cap	Polymers	Water	Starch	Revegetation
Cost of Application	\$150-\$180/acre	\$500-\$1,000/acre	\$20-\$40/acre	\$150-\$180/acre	\$1,000+/acre
Duration of Application	6+ months	3-6 months	1-10 days	30 days	Permanent
Durability	1800 psi	N/A	N/A	N/A	N/A
Erosion Control	Good	Minimal	None	None	Excellent
Color	As Desired	None	None	None	Various

Dust emission control doesn't have to be expensive or futile. Poz-o-Cap is a patented product designed to control dust wherever it becomes a problem - from mine tailings piles to construction sites.

For more information on how Poz-o-Cap can improve your dust control, call -

# Environmental Statement

related to operation of  
**SHOOTING CANYON**  
**URANIUM PROJECT**  
**PLATEAU RESOURCES, LTD.**

July 1979

Docket No. 48-3038

U. S. Nuclear Regulatory Commission

Office of Nuclear Material  
Safety and Safeguards

F-1

## SUMMARY AND CONCLUSIONS

This Final Environmental Statement was prepared by the staff of the U.S. Nuclear Regulatory Commission and issued by the Commission's Office of Nuclear Material Safety and Safeguards.

1. This action is administrative.
2. The proposed action is the issuance of a Source Material License to Plateau Resources, Ltd., for the construction and operation of the proposed Shootering Canyon Uranium Project with a product ( $U_3O_8$ ) production limited to  $2.2 \times 10^5$  kg ( $4.9 \times 10^5$  lb) per year.
3. The following is a summary of environmental impacts and adverse effects.
  - a. Impacts to the area from the operation of the Shootering Canyon Uranium Project will include the following:
    - Alterations of up to 140 ha (350 acres) that will be occupied by the mill, mill facilities, borrow areas, tailings areas, and roads.
    - An increase in the existing background radiation levels of the mill area as a result of continuous but small releases of uranium, radium, radon, and other radioactive materials during construction and operation.
    - Socioeconomic effects on the local area, particularly the proposed community of Ticaboo, where the majority of workers will be housed during project construction and operation.
    - Production of solid waste material (tailings) from the mill at a rate of about 680 MT (750 tons) per day and deposition as a slurry in an onsite impoundment area.
  - b. Surface water will not be affected by normal milling operations. Mill process water will be taken from the Navajo aquifer, and process water will be discharged to the tailings impoundment at about  $0.68 \text{ m}^3$  (150 gal) per minute. Some  $6.9 \times 10^5 \text{ m}^3$  (538 acre-ft) of water per year may be utilized by the project.
  - c. There will be no planned discharge of liquid or solid effluents from the mill and tailings site. The discharge of pollutants to the air will be small and the effects negligible. The estimated total annual whole-body and organ dose commitments to the population near the mill site are presented below. Natural background doses are also presented for comparison. The dose commitments from normal operations of the proposed Shootering Canyon mill will represent only very small increases in doses from current background radiation sources.
  - d. Construction and operation of the Shootering Canyon mill will require the commitment of small amounts of chemicals and fossil fuels, relative to their abundance.
  - e. Construction and operation of the Shootering Canyon mill will provide employment and induced economic benefits for the region but may also result in some socioeconomic stress.
  - f. The tailings disposal impoundment, occupying up to 28 ha (70 acres) when filled with tailings solids, may be unavailable for further productive use. However, when reclamation is completed and testing shows that radiation levels have been reduced to acceptable levels, it may be possible to return the tailings area to its former use as potential grazing land. After reclamation, the area topography will be similar to its present state.

- b. The applicant shall control release of airborne particulates from tailings by use of a water sprinkler system, chemical stabilization, covering with soil, or other equivalent means until reclamation of the tailings is completed.
  - c. The applicant shall implement the environmental monitoring program described in Table 6.2 of this document. The applicant shall establish a control program that shall include written procedures and instructions to control all environmental monitoring prescribed herein and shall provide for periodic management audits to determine the adequacy of implementation of these environmental controls. The applicant shall maintain sufficient records to furnish evidence of compliance with these environmental controls. In addition, the applicant shall conduct and document an annual survey of land use in the area surrounding the proposed project.
  - d. Before engaging in any activity not assessed by the NRC, the applicant shall prepare and record an environmental evaluation of such activity. When the evaluation indicates that such activity may result in a significant adverse environmental impact that was not assessed or that is greater than that assessed in this Environmental Statement, the applicant shall provide a written evaluation of such activities and obtain prior approval of the NRC for the activity.
  - e. The applicant shall immediately notify the NRC and the Office of the State Historic Preservation Officer if artifacts are discovered during construction of the mill or tailings disposal areas and shall have an archaeological survey performed prior to disturbing any previously unsurveyed areas.
  - f. If unexpected harmful effects or evidence of irreversible damage not otherwise identified in this Environmental Statement are detected during construction and operation, the applicant shall provide to the NRC an acceptable analysis of the problem and a plan of action to eliminate or reduce the harmful effects or damage.
  - g. The applicant shall provide for stabilization and reclamation of the mill site and tailings disposal areas and mill decommissioning as described in Sects. 3.3 and 10.3 of this document.
  - h. The applicant shall provide surety arrangements to ensure completion of the mill site and tailings area stabilization, reclamation, and decommissioning plans.
8. The position of the NRC is that, after weighing the environmental, economic, technical, and other benefits of the operation of Shootering Canyon Uranium Project against environmental and other costs and after considering available alternatives, the action called for under the National Environmental Policy Act of 1969 and 10 CFR Part 51 is the issuance of a Source Material License subject to conditions 7a through 7h, above.

As announced in a *Federal Register* notice dated 3 June 1976 (41 FR 22430), the NRC is preparing a generic environmental statement on uranium milling. Although it is the NRC's position that the tailings impoundment method discussed in this Statement represents the most environmentally sound and reasonable alternative now available at this site, any NRC licensing action may be subject to revision in accordance with the conclusions of the final generic environmental impact statement and any related rule making.

**Annual population dose commitments<sup>a</sup>  
within an 80-km (50-mile) radius  
of the mill site**

Receptor organ	Dose (man-rems/per year)	
	Plant effluents	Natural background <sup>b</sup>
Total body	1.50	329
Lung	10.5	329
Bone	6.13	329
Bronchial epithelium	66.0	1631

<sup>a</sup>Based on a projected year-2000 population of 3264.

<sup>b</sup>The estimated natural background dose rate to the whole body is 101 millirems/year. The bronchial epithelium dose from naturally occurring radon-222 is assumed to be 500 millirems/year (Sect. 2.10).

4. Principal alternatives considered are as follows:

- a. alternative sites for the mill,
- b. alternative mill processes,
- c. alternative of using an existing mill,
- d. alternative methods of tailings management,
- e. alternative energy sources, and
- f. alternative of no licensing action on the mill.

5. The following Federal, State, and local agencies have been asked to comment on this Draft Environmental Statement:

Department of Commerce  
 Department of the Interior  
 Department of Health, Education, and Welfare  
 Federal Energy Regulatory Commission  
 Department of Energy  
 Department of Transportation  
 Environmental Protection Agency  
 Department of Agriculture  
 Advisory Council on Historic Preservation  
 Department of Housing and Urban Development  
 Utah State Planning Coordinator

- 6. This Final Environmental Statement was made available to the public, to the Environmental Protection Agency, and to other specified agencies in July 1979.
- 7. On the basis of the analysis and evaluation set forth in this Environmental Statement, it is proposed that any license issued for the Shootering Canyon mill should be subject to the following conditions for the protection of the environment:
  - a. The applicant shall construct a tailings disposal facility that will incorporate the features described in Alternative 1 of Sect. 10.3 and in Sect. 3.2.4.7 and that will meet the safety criteria specified in NRC Regulatory Guide 3.11.

## U.S. Energy Corporation

### Locations

#### *The Shootaring Mill*

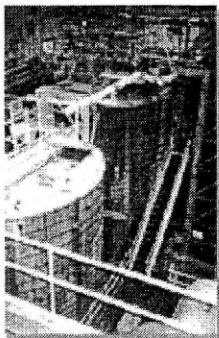

Plateau Resources Limited was organized in 1976 as a wholly owned subsidiary of Consumers Power Company of Michigan to provide uranium concentrates for processing into fuel for Consumers' nuclear power plants. Plateau Resources initiated an aggressive exploration program almost immediately following its formation. Consumers invested about \$140 million in the Plateau facilities near Ticaboo, Utah.

In 1993 U.S. Energy Corp. acquired all outstanding stock of Plateau Resources Limited from Consumers. As part of the deal, U.S. Energy Corp. acquired the essentially new Shootaring Canyon uranium mill, and a townsite infrastructure. The mill was built in 1981 at a cost of \$54 million and was designed to process 750 tons of uranium ore per day, but operated only on a trial basis for two months in 1982. Operating the mill at this level, depending on ore grade, would yield between 1 and 2 million pounds U<sub>3</sub>O<sub>8</sub> per year. Results of testing performed at the mill in 1982 indicate that the circuit could be operated at a capacity of 1 thousand tons per day without any modifications. Through its acquisition of Plateau, U.S.

Energy Corp. has gained access to substantial uranium resources in southeastern Utah. Contiguous to the Tony M mine are the Southwest, Copper Bench, and Indian Bench deposits, which compose the Bullfrog properties. These deposits are reported to contain up to 17 million pounds of uranium. Where they are owned by Energy Fuels, their proximity to the Tony M Mine and short haul (three to five miles) to the Shootaring Canyon mill make them prospective sources of ore for the mill.

[BACK TO THE TOP](#)

The Shootaring Canyon mill will treat uranium ores utilizing a conventional process circuit that includes grinding, acid-leach, solvent extraction and precipitation of yellowcake. The facility occupies 114 acres of Plateau's 270-acre plant site, which is only three miles south of the Tony M mine portals.

Deseret Morning News, Saturday, February 24, 2007

## **SXR Uranium One to buy mothballed plant in Utah**

TORONTO (Dow Jones/AP) — Canadian miner SXR Uranium One Inc. said it will buy a uranium processing plant and uranium fields from U.S. Energy Corp. and its Crested Corp. affiliate for stock and cash worth about \$101 million.

Uranium One said it will purchase the mothballed Shootaring Canyon Uranium Mill in Utah and uranium exploration properties in Utah, Wyoming, Arizona and Colorado.

It is paying 6.6 million shares, plus \$750,000 in cash.

Uranium One also has agreed to pay U.S. Energy, based in Riverton, Wyo., \$20 million when the mill starts commercial production and \$7.5 million on the first delivery of uranium to the mill from any of the purchased properties.

U.S. Energy also will receive a royalty of 5 percent on the sale of uranium produced at the mill, to a maximum of \$12.5 million.

The Shootaring Canyon Mill is about 48 miles south of Hanksville, Wayne County. The mill was commissioned and operated for four months in 1982 and has been maintained in "excellent condition" since then.

**EXPLORATION DRILLING** Exploration drilling was initiated in the vicinity of outcrop mineralization during 1976. By the year 1983 approximately 2,000 rotary drill holes totaling nearly 1,000,000 feet have been completed on the property. Drilling continued in order to better define the details of the ore bodies. Within a radius of 2 sq. miles around the property, several exploratory pits, channels and dozer cuts have been made to study the host rocks.

GEOLOGY COMMENTS N55< The host sandstone is light gray to gray, massive, bedding mostly indistinct, has small gray pellets in layer

1/2 to 1 inch thick, medium-grained to conglomeratic, soft, weakly cemented by calcite and clay, sugary, bleached, sometimes cross-bedded. Mudstone and shale interbeds are red, gray to brown and lenticular. Few discontinuous thin and discontinuous bands of gray to brown siltstones are also found. The interbeds of conglomerates are yellow, brown and buff, with chert pebbles upto 1/2 inch in diameter which make up from 10 to 90 percent of the total volume of the rock. The host rocks contain abundant wood fragments and carbonaceous matter. Limonitic and hematitic stains, and veins of calcite and quartz are occasionally found. Fracturing, alteration, and bleaching of the host rocks are the characteristic features. >

## GENERAL COMMENTS

General comments: GENC The ore bodies consist of a concentration of various uranium and vanadium minerals in sand lenses. Most of the ore minerals occupy pore spaces in the sandstone and conglomerates. The largest and richest ore bodies are elongate and crudely semicylindrical (semi-cylindrical "rolls") that occur in groups in the sand lenses. However, mineralization in general follows the bedding planes. The ore is always accompanied by organic material of some kind, by limonite and hematite staining in associated host rocks, by argillization and bleaching of sandstones and conglomerates, and by blue-green color alterations in the mudstones below the deposits. Mudstone is barren except where it occurs as thin partings or lenses within sandstones, or lies at contact of mineralized sandstones or in the form of rounded pellets in the host rocks. The rich ore bodies are found along the edges of thicker sand channels, especially along meander curves, which are favorable sites for plant accumulation, and hence for the formation of uranium-vanadium deposits.

## AGATE (Cont)

### DIMENSIONS AND DESCRIPTIONS OF ORE BODY

Type - Replacement, replacing of the country rock or other minerals by valuable minerals from a solution.

Mode of origin - Other

Shape - Podlike to tabular-flat, table-like or stratified ore body, relatively long in two dimensions and short in one dimension.

Controls - Lithology

Wall alteration and degree of wallrock alteration - Undetermined

Depth to ore zones - 5-200'+

Average length - 25'

Average width - 10'

Average thickness - 3'

### STRUCTURE

Simple folding or tilting

### MINERALOGY

Uranium-vanadium minerals are aphanitic to fine grain crystals

Carnotite

Roscoelite

### MINING

Method - Gophering (Coyoting), room and pillar

Rock hardness and water conditions - soft non-plastic rocks, sandstones, limestones, little or no water

Class of rock masses - the rock mass shows a series of parallel planes of weakness such as the planes of stratification in a sedimentary rock or sheeting planes of an igneous rock. Such a rock mass is strongest in a direction parallel with such planes. Sandstones, limestones, shales, slate and sheeted igneous rocks are examples.

Support characteristics - the rock mass is self-supporting, needing timber only for chutes, raises, etc. Strip mining.

### PRODUCTION

#### Shoetering Creek

1957 - 250 tons ore, 7,380 lbs. uranium, 11,388 lbs. vanadium

1956 - 5,990 lbs. uranium, 9,681 lbs. vanadium

1955 - 382 tons ore, 12,291 lbs. uranium, 22,981 lbs. vanadium

1954 - 192 tons ore, 5,993 lbs. uranium, 12,564 lbs. vanadium

#### Klippel and Mangus (Lucky Strike 10)

1964 - 201 tons ore, 4,078 lbs. uranium, 1,602 lbs. vanadium

1965 - 106 tons ore, 939 lbs. uranium, 6,007 lbs. vanadium

## EAGLE (Cont)

### DIMENSIONS AND DESCRIPTIONS OF ORE BODY

Type - Replacement, replacing of the country rock or other minerals by valuable minerals from a solution

Mode of origin - Other

Shape - Tabular-flat, Table-like, or stratified ore body, relatively long in two dimensions and short in one dimension, podlike

Controls - Lithology

Wall alteration and degree of wallrock alteration - Undetermined

Depth to ore zone ~ 100-300'

Average thickness - 3'

### STRUCTURE

Simple folding or tilting

### MINERALOGY

Uranium-vanadium minerals are aphanitic to fine grain crystals

Carnotite

Roscoelite

Hewettite

Bedded, shallow scours, discontinuous thin pods. Ore deposits are called "buttons", 3-8" thick, 25' square

### MINING

Method - Gophering (Coyoting) room and pillar

Rock hardness and water conditions - soft non-plastic rocks, sandstones, limestones, little or no water

Class of rock masses - the rock mass shows a series of parallel planes of weakness such as the planes of stratification in a sedimentary rock or sheeting planes in an igneous rock. Such a rock mass is strongest in a direction parallel with such planes. Sandstones, lime stones, shales, slate and sheeted igneous rocks are examples.

Support characteristics - the rock mass is self-supporting, needing timber only for chutes, raises, etc.

Exploratory drifting, room and pillar stopes

### PRODUCTION

Shipper: Union Carbide Nuclear Company (Doellings IBM sheet)

Lone Eagle 2:

1965 - 95 tons ore, 272 lbs. uranium, 822 lbs. vanadium

1964 - 4 tons ore, 142 lbs. uranium, 164 lbs. vanadium

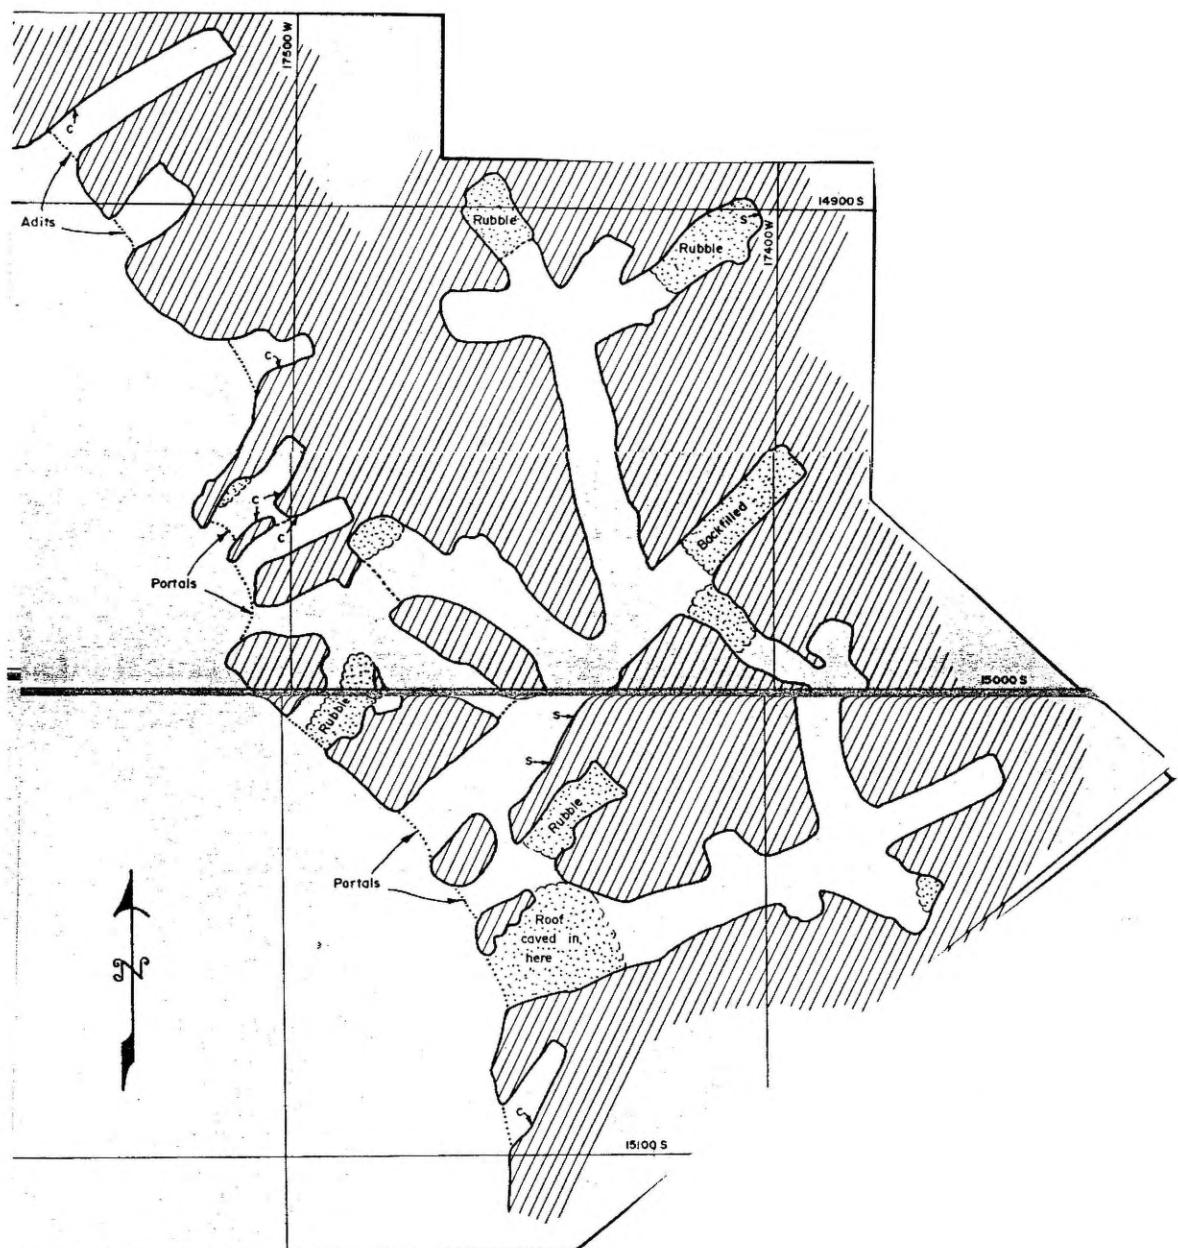

### MISCELLANEOUS

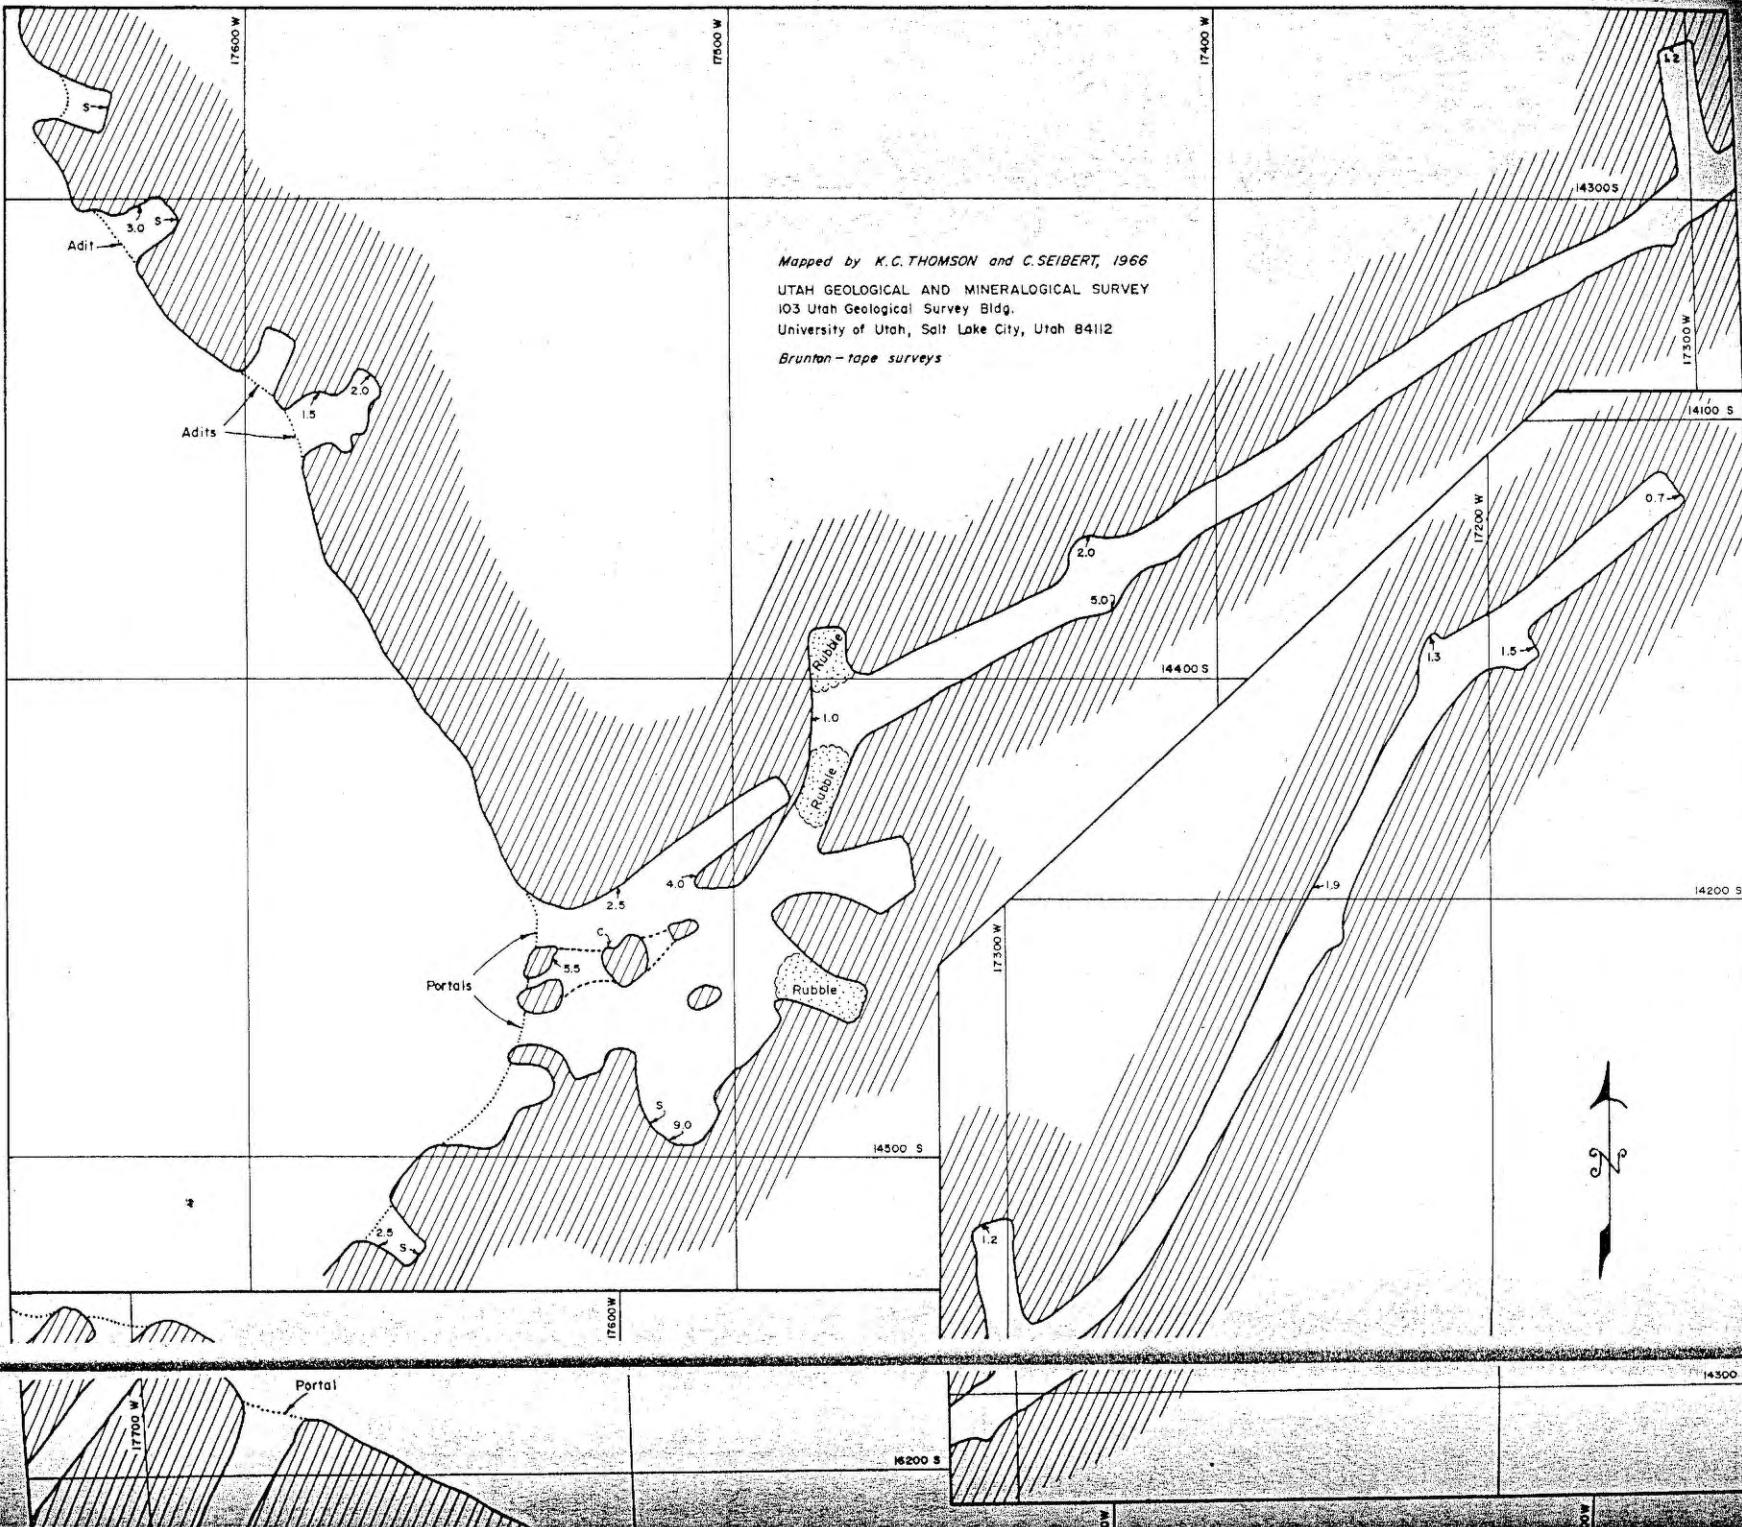

Lone Eagle 1, 3, 9 same as Eagle Mine (Discovered 1952) Last work August 1973 by Dal Peterson, Geological Investigation, design of leaching operation, heavy equipment work

## LUCKY STRIKE 8-9 (Cont)

### DIMENSIONS AND DESCRIPTIONS OF ORE BODY

Type - Replacement, replacing of the country rock or other minerals by valuable minerals from a solution.

Mode of origin - Other

Shape - Tabular-flat, table-like, or stratified ore body, relatively long in two dimensions and short in one dimension, podlike

Controls - Lithology

Wall alteration and degree of wallrock alteration - Undetermined

Depth to ore zone - 50'-300'

Average thickness - 3'

### STRUCTURE

Simple folding or tilting

### MINERALOGY

Uranium-vanadium minerals are aphanitic to fine grain crystals

Carnotite

Roscoelite

High vanadium

Low lime

Bedded carnotite in shallow scours

### MINING

Method - Gophering (Coyoting) room and pillar

Rock hardness and water conditions - Soft non-plastic rocks, sandstones, limestones, little or no water

Class of rock masses - the rock mass shows a series of parallel planes of weakness such as the planes of stratification in a sedimentary rock or sheeting planes in an igneous rock. Such a rock mass is strongest in a direction parallel with such planes. Sandstones, lime stones, shales, slate and sheeted igneous rocks are examples.

Support characteristics - the rock mass is self-supporting, needing timber only for chutes, raises, etc.

Leaching in ponds being set up 2-2-74.

### PRODUCTION

Agate #1 Shipped by Harold Ekker

1965 - 12 tons ore, 202 lbs. uranium, 242 lbs. vanadium

1964 - 13 tons ore, 135 lbs. uranium, 404 lbs. vanadium

Union Carbide shipper: Agate #2

1965 - 132 tons ore, 1,975 lbs. uranium, 4,308 lbs. vanadium

1964 - 29 tons ore, 470 lbs. uranium, 1,162 lbs. vanadium

LUCKY STRIKE 8-9 (Cont 2)

PRODUCTION

Agate #9

1965 - 85 tons ore

1964 - 7 tons ore

Agate #4

1965 20 tons ore, 107 lbs. uranium, 311 lbs. vanadium

Agate #8

1965 - 8 tons ore, 46 lbs. uranium, 205 lbs. vanadium

Shipper : Jesse Ekker

Lucky Strike #9

1965 - 35 tons ore, 368 lbs. uranium, 697 lbs. vanadium

1964 - 76 tons ore, 1,024 lbs. uranium, 1,408 lbs. vanadium

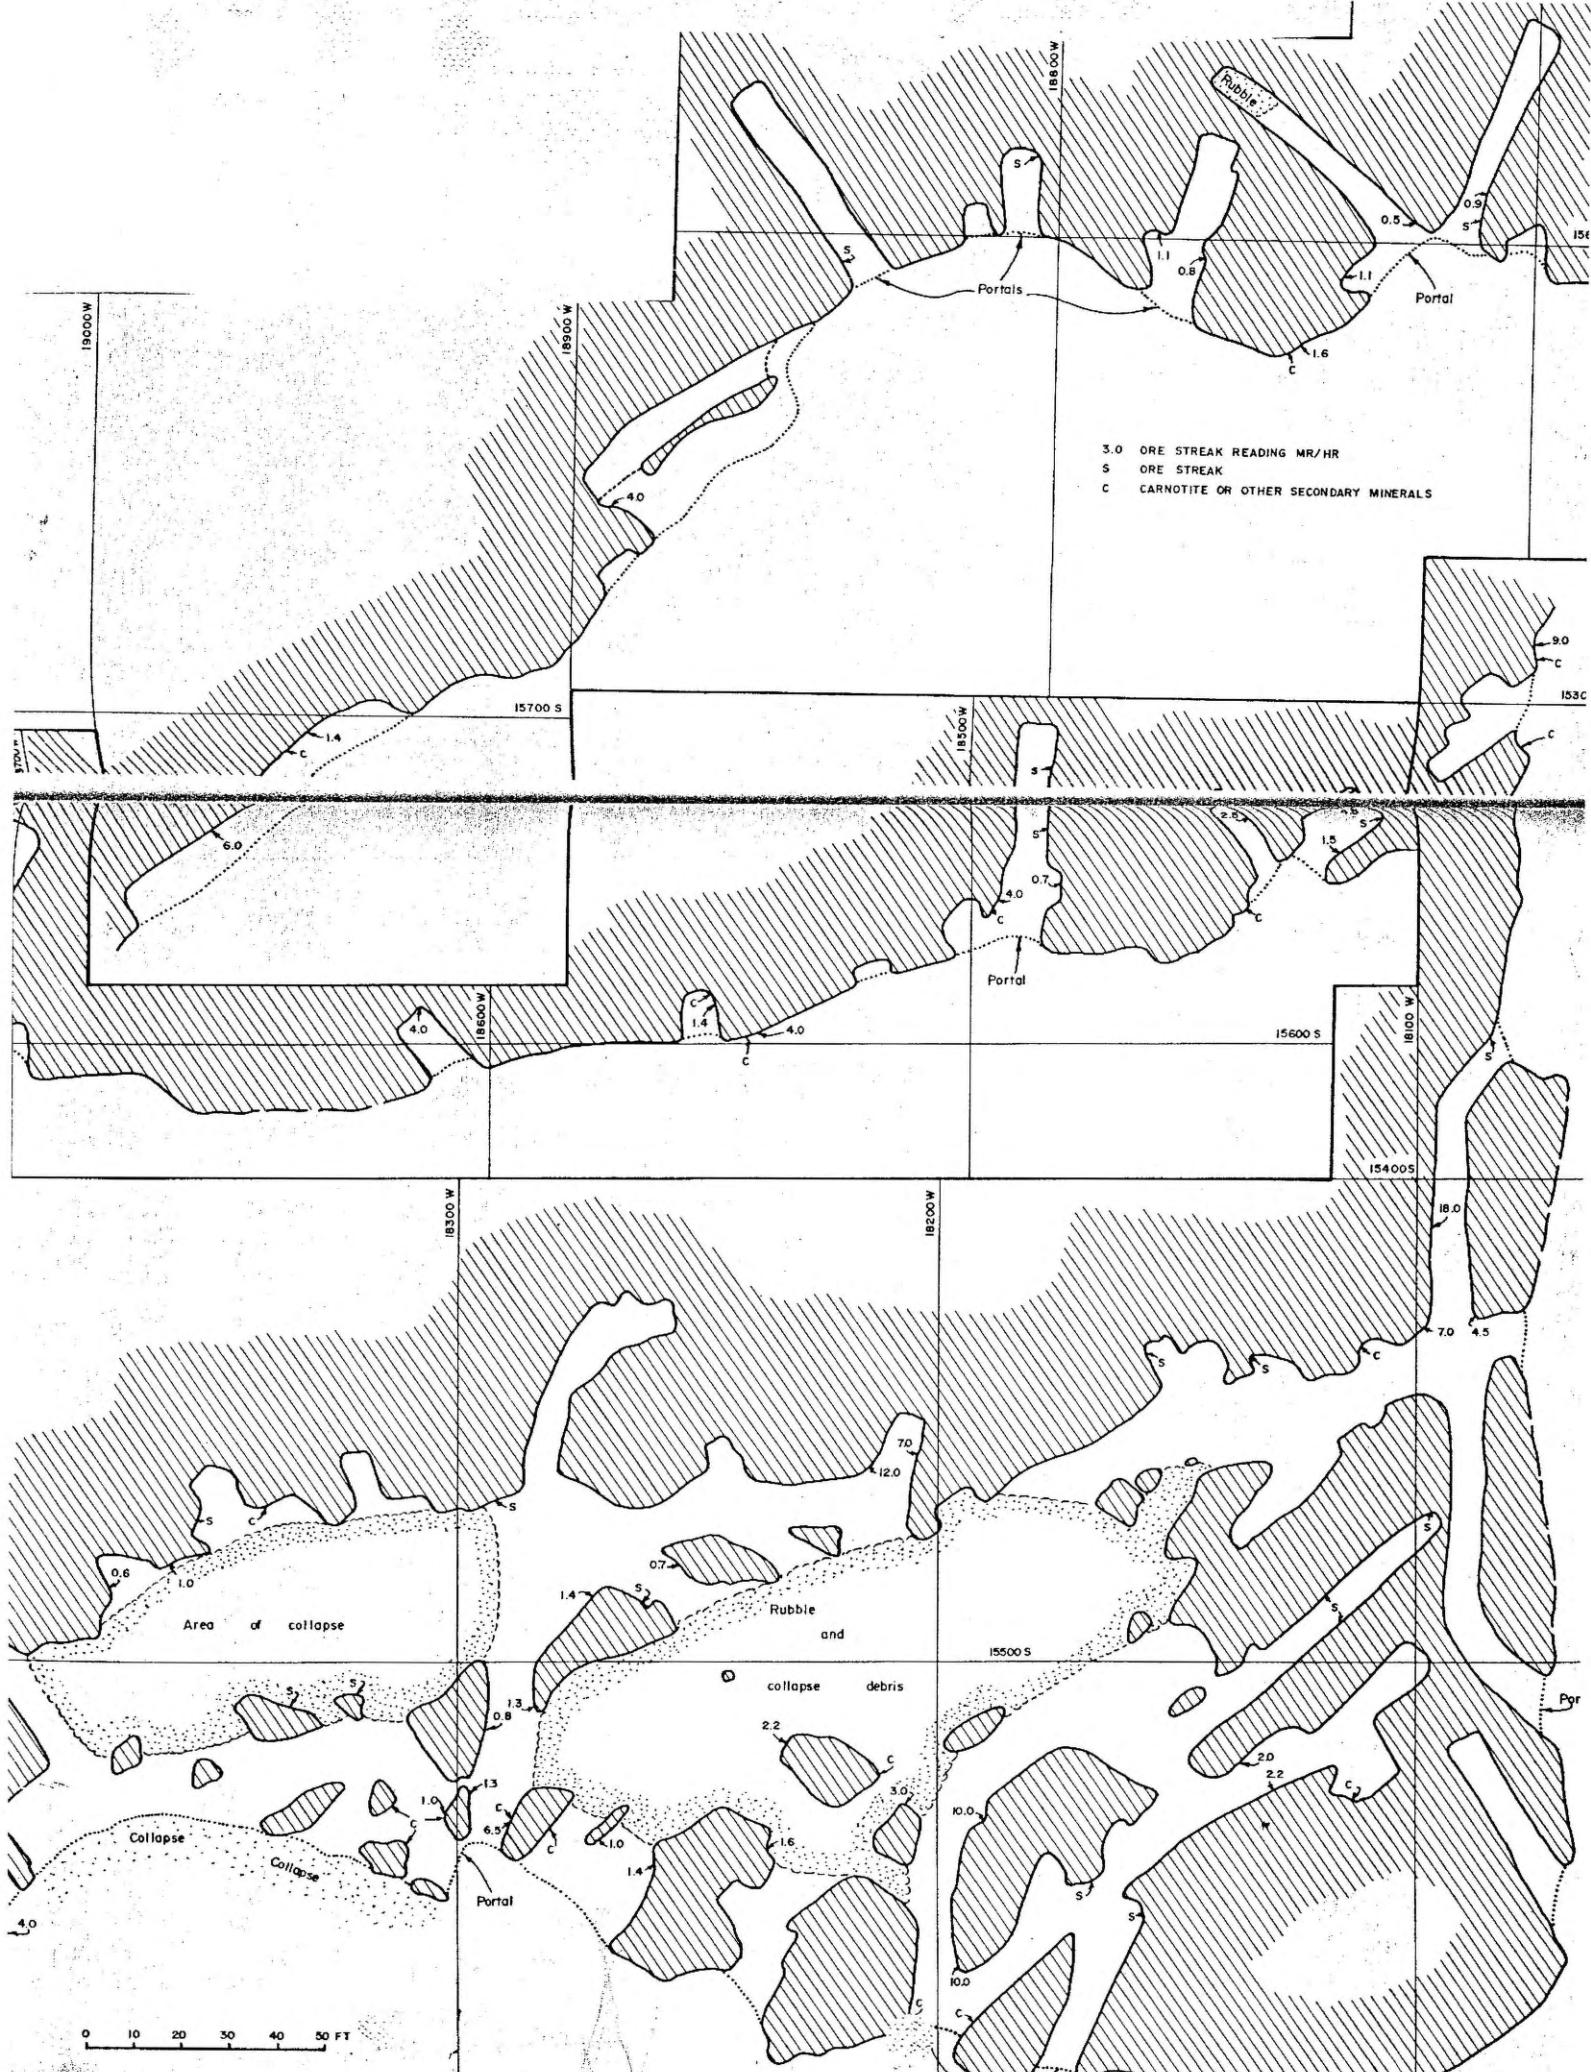

MISCELLANEOUS

Lucky Strike - Agate Claims

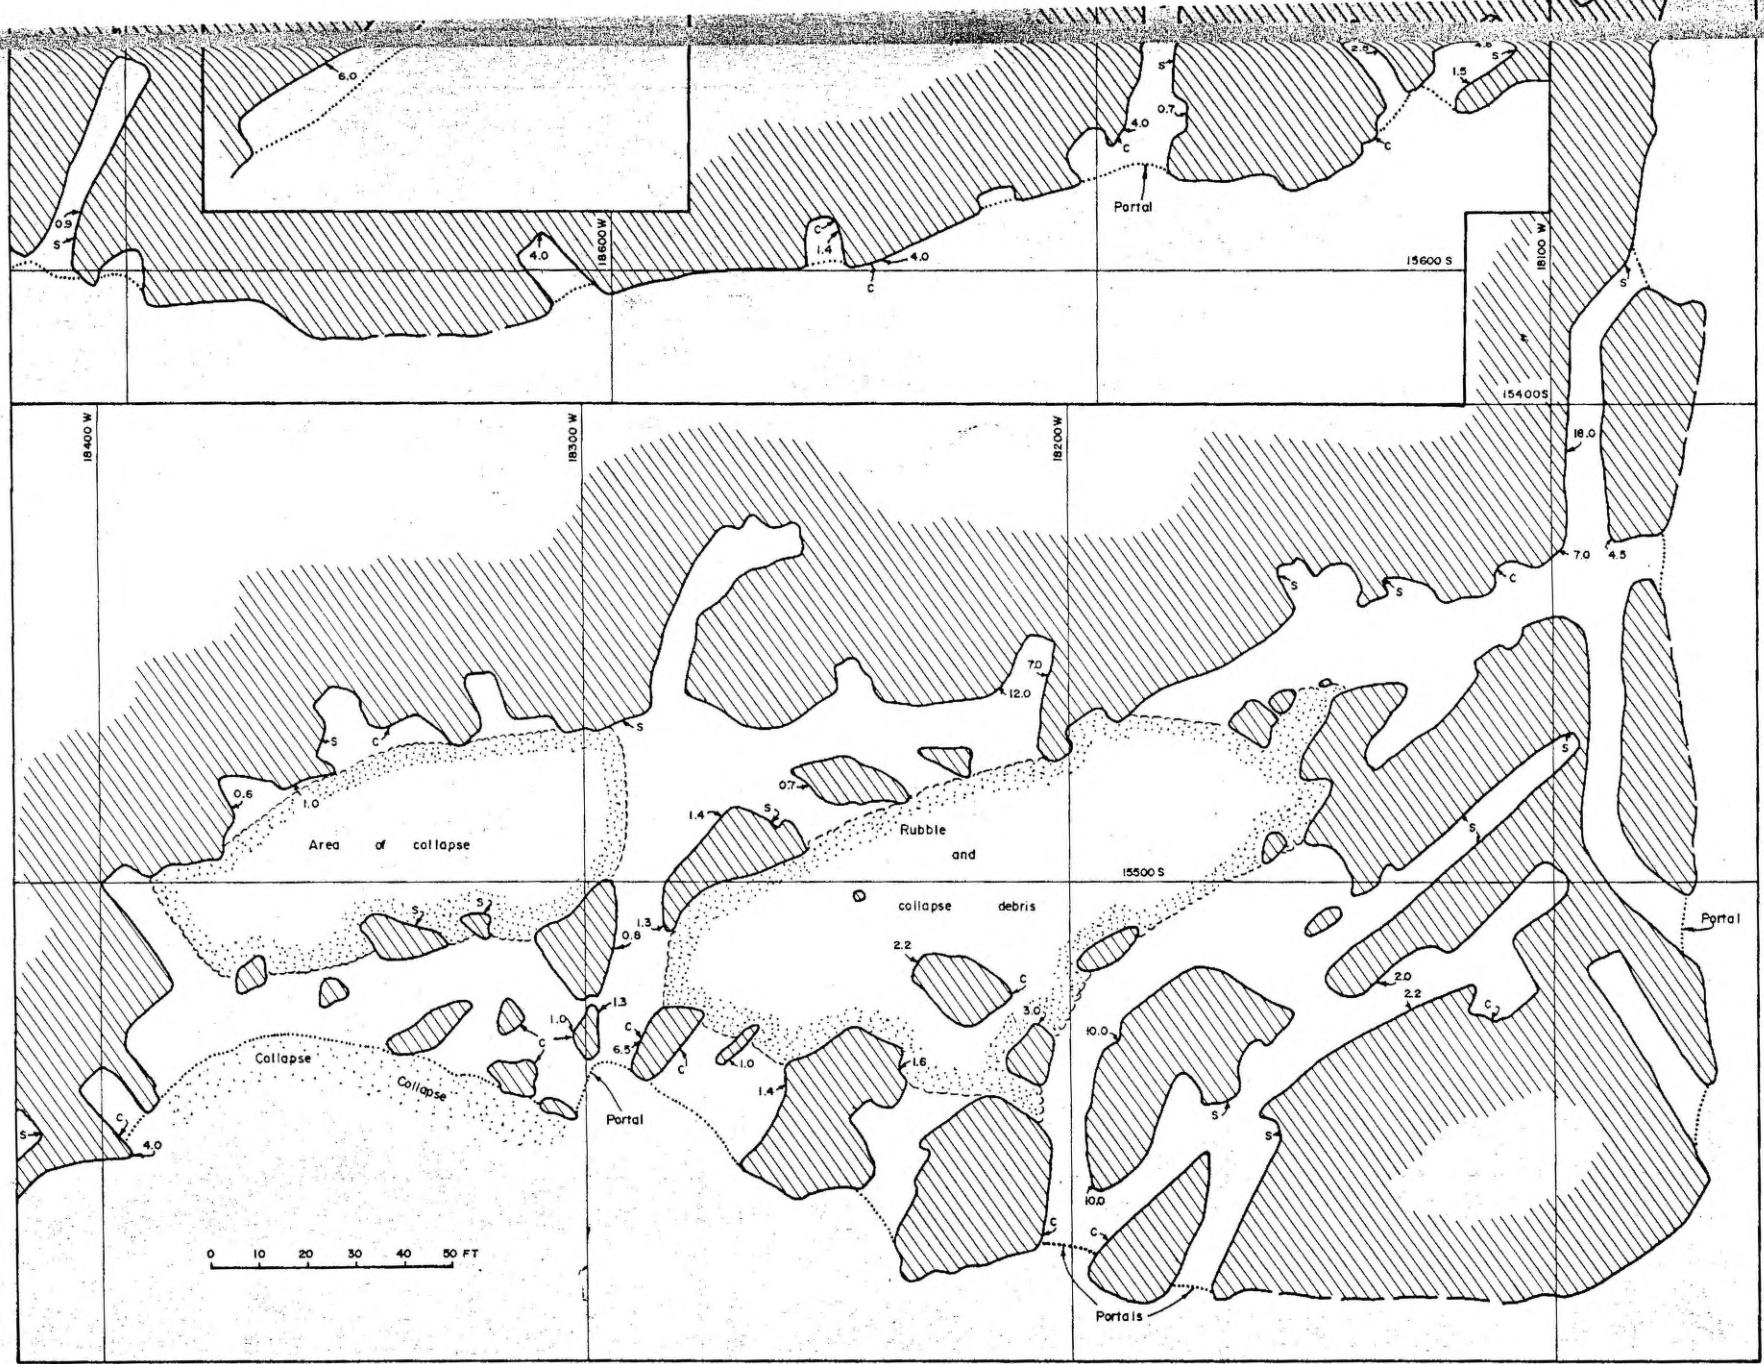

Agate claims #1-6 In Hansen Creek

SUBJECT TONY M ORE RESERVE CALCULATIONS BY THE U.S.D.O.E.

INTERNAL CORRESPONDENCE

CC

dkr

Please find attached a summary of ore reserve calculations by the U.S. Department of Energy for the Tony M mine. The D.O.E. ore reserve totals compared to my 6-1-78 ore reserve totals are as follows:

D.O.E. (10-15-78) -- 3.4 MM tons of 0.116% U<sub>3</sub>O<sub>8</sub>  
Thamm (6-1-78) -- 2.7 MM tons of 0.115% U<sub>3</sub>O<sub>8</sub>

The two ore reserve figures can be compared against each other in that the same number of holes and the same basic data were used in both calculations. Although there is good agreement on the average grade (both are diluted mining grades), there is a significant difference in total tons. The area method of ore reserve calculation, used by the D.O.E., is an accepted method used by many mining companies. In most cases, ore reserves calculated by this method will be larger than those calculated by the more conservative polygon method which was used in my reserve calculations of 6-1-78. I would conclude that the two calculations adequately bracket the most probable range of the Tony M ore body, based on the presently available information. The average of the two results,  $\pm$  3.0 MM tons of 0.115% U<sub>3</sub>O<sub>8</sub>, should provide a good basis for mine planning.

The D.O.E. maps identifying individual ore reserve areas and the accompanying cross sections and drill hole data are on file in D. H. Underhill's office.

J. K. Thamm

GENERAL

Completed shop and warehouse by-pass road to mine enty area. Base gravel and top gravel must be spread for final road completion. Surface mine dewatering pumping system was finished. Mine water is pumped to the old evaporation pond and from the old pond pumped through new pipe line to construction area for the new evaporation holding pond.

TECHNICAL SUPPORT

Final design on stairway from mine dry to the mine portal was finalized and transferred to construction.

Surface location for three ventilation bore holes were established and a survey traverse completed for underground holing out position. The engineering aspect of the technical support group received the most attention in November. Projects have been outlined, defined, prioritized, and assigned to individual supervisors.

The rough outline of the Tony M ventilation plans has been calculated in two different ways, and a third assessed for its applicability to the problem. These figures will be checked by computer in Denver Technical Support Center, but the spread in results is sufficient to assure that refinement will not change the solution indicated. This alternate is very attractive from a power and cost standpoint.

Beginning in 1981 with present staff coupled with a sizable increase in development, the Geology Departemnt will need added personnel to maintain adequate geologic control.

Monthly Report, November, 1981

EF Jacobson, GJ

December 15, 1980

#### MAINTENANCE

Shop - warehouse bypass road is near completion. The clean up behind the shop in the creek bed was finished,

Equipment availability for mine muck removal was an on-going problem in the month of November.

A mine mechanic service crew will perform pre-shift service starting in December.

Continued work on change building heating system.

Removed remaining overhead power lines over new by-pass road from the camp to the shop area.

#### TONY M SECTION

Development footage for November was not up to expectation. Factors for development shortage was equipment break downs and ventilation maintenance of the haulage ways improved. A road drag unit was fabricated and placed into use along with the Bladmore grader. The length of the laterals have reached a point that in some areas it is as far to the main haulage as it is from lateral entry to the portal exit.

A new training group of five employees was started in November. The training crew was used in the pipe installation on dewatering pond #2. It was a good project for the class as it gave the new employees excellent experience in correct handling and installation of vectaulic piping.

#### GRAND JUNCTION ADMINISTRATION

Time was spent on the 1981 budget to obtain a more realistic budget. Cost engineering studies were completed and these results incorporated.

1980 mine project results were reviewed and short falls returned for and engineering study.

A visit through the Rio Algom's Lisbon Mine was made.

#### FUTURE PLANS

Prepare and plan 1981 projects.

Complete three ventilation bore holes.

Pump out and start up haulage level development.

PLATEAU RESOURCES LIMITED

EXPLORATION DEPARTMENT  
SUMMARY OF THE 1979 PROGRAM  
AND OBJECTIVES FOR 1980

INTRODUCTION

The primary objective of the Exploration Department is to discover uranium ore of sufficient grade and quantity which may be mined in order to meet the financial objectives of Plateau Resources. Through reconnaissance programs, target areas are selected for land acquisition and further exploration. Successful exploration evaluations delineate properties which are then drilled in sufficient detail to indicate that ore is present in such concentration that feasibility study is required.

Discovery of new ore bodies is a challenging task which requires a dedicated commitment of manpower and other resources. The discovery of the Shootering Canyon ores is included with a handful of significant uranium discoveries made in the U. S. within the last four years. Sufficient ores have been discovered at Shootering to justify the development of the mine and mill complex. Based on the results of 1979 drilling, an updated reserve estimate has been completed for the Shootering Canyon area.

EXPLORATION DEPARTMENT

The Exploration Department consists of 35 personnel, including Geology, Land, Drafting, and Reclamation groups. Responsibility is divided on a geographic basis with a Henry Mountain District, a Blanding District and Other Areas. The Geology Department is comprised of geologists, with survey and clerical backup. This group evaluates properties for acquisition, and explores those properties which are acquired. They are also responsible for development drilling and for making estimates of ore reserves once significant mineralization is located. The Land Department provides title evaluations, negotiates acquisitions and develops and administers property records. The Drafting Department prepares land and geologic maps and drawings. The Reclamation staff is responsible for rehabilitation of exploration sites and roads.

EXPLORATION PROGRAM

The rocks of the Chinle and Morrison Formations occur over a very large region which comprises Plateau's principal area of exploration. This includes at least 50,000 square miles. On the other hand, Uranium ore bodies occupy a very small portion of the area. The challenge of exploration is to develop techniques which most efficiently locate previously undiscovered ore bodies.

The uranium ores of the Chinle and Morrison Formations are primarily located within and along the margins of channel sands of fluvial origin. Geologic favorability is indicated by sand thickness, sandstone/mudstone

ratios, alteration related to mineralizing fluids, the presence of carbon and clays in sands, the presence of uranium mineralization, etc.

In the past, many ore bodies have been found by prospecting and locating outcropping ores and by drilling behind old workings. Modern discoveries, however, require integrated exploration techniques directed at discovering buried targets at depths varying from a few feet to 1000 feet or more.

Although exploration could be inefficiently performed based on drilling randomly located holes, Plateau's goal and major commitment is to establish an understanding of regional and local geology so as to optimize the probability of success in the most cost efficient manner.

In order to attain this goal, Plateau presently has major ongoing programs both for systematic collection of field and published geologic data and for the compilation and interpretation of this data in order to define those target areas that have the highest potential for delineating ore bodies. The first phase of this program is nearly complete for the Uravan area. Chinle target areas have not yet been finalized. Field geology, land title work, geophysics, geochemistry, and rotary drilling supplemented with selected core drilling are utilized to test these target areas and establish the concentration and extent of uranium mineralization.

#### PROPERTY HOLDINGS

A major responsibility of the Land Department is to obtain control of properties on which exploration drilling is to be performed. The properties currently under control consist primarily of unpatented mining claims, but also include state leases and fee land. A summary of property holdings is given below.

	<u>Acres</u>
Henry Mountain District	92,000
Paradox Basin District	78,000
Other Areas	16,000
Joint Venture	<u>63,000</u>
Total Acreage	249,000

#### DRILLING ACTIVITIES

The primary exploration technique used to discover uranium is rotary drilling. Rediometric logging surveys, with associated chemical analyses, are used to determine the presence and concentration of the uranium mineralization. A summary of drilling activities is given on the following page.

		<u>Number of Holes</u>	<u>Feet Drilled</u>
Henry Mountain District	Through	196	82,391
Blanding District	August 1979	368	139,850
Other Areas		70	71,315
1979 Total		634	293,556
1978 Total		3,102	601,810
1977 Total		3,185	765,911
	GRAND TOTAL	6,921	1,660,677

#### ORE RESERVES

Results of the exploration program in the Shootering area have defined ore reserves within 2 major mine units in the Shootering Canyon Project area (i.e., Tony M and Frank M) and also located lesser reserves within 7 areas located in the Blanding District. Ore reserve estimates for the Shootering area have been made using conservative (industry) standards. In addition, drilling results are only in the preliminary stage for the Blanding properties. Therefore, it is reasonable to expect that there will be a significant increase in reserves as development continues.

An updated reserve estimate has been prepared based on additional drilling which has been performed in the Shootering area. As a result, the following additions to reserves have been made:

#### SUMMARY OF CHANGES IN SHOOTERING ORE RESERVES

	<u>Increase</u>	<u>New Total</u>	<u>Percent Increase</u>
Indicated Pounds	460,000	7,210,000	7
Potential Pounds	1,620,000	4,040,000	67
Total Pounds	2,110,000	11,250,000	23

This addition to reserves could add approximately four years to the projected project life at Shootering.

#### OBJECTIVES OF THE 1980 EXPLORATION PROGRAM

The 1980 objectives of the department will focus on the discovery and development of additional ore reserves within the haulage distance to the Shootering processing facility.

- (1) Pre-engineering drilling will take place on 4 properties (three in Blanding and one in Shootering) which are known to host ore.
- (2) Exploration evaluation will continue on all properties presently held by Plateau in order to determine whether sufficient potential exists to warrant additional work.

- (3) Land and geologic reconnaissance will take place in order to determine the favorability of approximately thirty target areas defined by the 1979 Uravan Compilation Program. Land acquisition will be initiated in those areas which are still found to have favorable characteristics once the reconnaissance evaluation is complete.
- (4) A systematic compilation and geologic analysis will be initiated for the Henry Mountains District. This program will define areas of favorability similar to the results of the Uravan Study. This program will also provide a standardized data base on which all future regional work can be based.
- (5) Geologic model generation and regional evaluation will be performed in order to provide a basis for future exploration programs of Plateau.

CHRONOLOGICAL HISTORY OF THE SHOOTERING CANYON PROJECT  
AND PLATEAU RESOURCES LIMITED

190 million years before present -- Deposition of Salt Wash Member within a braided stream system. Uranium ore deposited from ground waters.

38 million years before present -- Intrusion of Mount Hillers and other Henry Mountain igneous rock bodies.

1938 -- Lucky Strike claims located in Shootering Canyon.

1943 -- Manhattan Project related geologic studies to locate uranium included mapping and investigations of the Henry Mountain area.

1913 to 1965 -- About 50,000 tons of uranium/vanadium ore produced from all of Garfield County.

1970 -- Rio Amex carried out drilling program in area of Tony M and Frank M Mine without sufficient success to continue program.

June 7, 1976 -- Plateau Resources Limited incorporated as a Utah Corporation.

February 1, 1977 -- Grand Junction office of Plateau Resources Limited established.

February, 1977 -- Ore first discovered in what was to become the Tony M Mine.

June 17, 1977 -- Woodward Clyde retained; site selection and environmental study initiated for planned mill.

August, 1977 -- Ore first discovered in what was to become the Frank M Mine.

September 27, 1977 -- Mountain States retained to design Shootering uranium processing facility.

May 1, 1978 -- Plateau occupied new offices at 772 Horizon Drive, Grand Junction.

May 5, 1978 -- License application submitted to Nuclear Regulatory Commission.

September 1, <sup>1977</sup> ~~1978~~ -- Driving the main haulageways for the Tony M Mine was started.

September 21, 1979 -- License received from Nuclear Regulatory Commission.
